

SAP Business Data Cloud (BDC)

A modern SAP data foundation that business and technical teams can trust.

SAP combines technologies like Datasphere, Databricks and Snowflake to create a solution where data can be stored, processed, and understood in a way that generates real business decisions, not just reports.

Where We Excel

- 
Data Platform Strategy and Roadmap –what moves, what stays, and why
- 
Data Governance, Discovery, and Operating Model so definitions and ownership are clear
- 
Integration of BDC with Hyperscalers (AWS and Microsoft Azure patterns and execution)
- 
Managed DataOps so the platform stays reliable as adoption grows
- 
Migration Planning for legacy SAP data approaches (including BW modernization decisions)
- 
Deep Expertise in SAP Datasphere and SAP Databricks to make the platform usable, not theoretical

Why Teams Come to Us

SAP is shifting customers toward a new data platform and you need a clear transition path. You want AI-ready data, but the semantic layer and governance are not consistent. Your current SAP data landscape is costly, slow, or too dependent on a few individuals. You need SAP and non-SAP data to work together without creating a compliance headache.

What You Can Expect

- 30**
DAYS

 - Platform and data landscape assessment
 - Candidate use cases
 - Governance blueprint
- 60**
DAYS

 - Target architecture and delivery plan
 - Plus a pilot dataset/product with business semantics
- 90**
DAYS

 - Repeatable pipelines
 - Defined ownership
 - The first production-grade outcomes

Why apiphani

We bridge SAP data depth with hyperscaler reality (AWS/Azure) so the design works in production.

We focus on execution that holds up under enterprise risk and uptime expectations.

We can carry the work beyond advisory into implementation and then into ongoing run.

When BDC is on your roadmap, we'll help you turn it into a well-structured foundation your teams will adopt and trust.
